AI carbon footprint?

Posted by u/AlarmingAttention151 • 0 points • 5 comments

Neural networks obviously require a huge amount of processing power to train and run, which must take huge amount of energy, and that means carbon emissions. Does anyone know of any information about modern AI's environmental impact and how it might scale up? How will we balance exponential growth of models and traffic with emission reduction goals? Am I overestimating their footprint?

According to chat GPT, using it in a small conversation is about 100 times as costly as a search engine search, in terms of electricity use. Training and designing LLMs costs hundreds of tonnes of CO2 emissions.

Don't care.

One reasonable estimate is [300 watt-seconds](<https://ai.stackexchange.com/questions/38970/how-much-energy-consumption-is-involved-in-chat-gpt-responses-being-generated>) per prompt.

Whatever it is, I feel it must still be less than blockchain.
