

How much power does an AI like ChatGPT need?

Posted by u/arembi • 0 points • 3 comments

I've been paying attention to the advancements in the field of AI for a while, and I understand, that a large part of everybody's work is or will be replaceable by it, maybe all of it someday. What I am curious about is that how big is the power consumption of such a system, and which part accounts for the most of it. Building the model, or having users prompt at regularly?

I mean, just with electric cars, if everybody would switch to an EV the electrical grid in most countries would collapse instantly, add a couple of thousand AI agents to that that are deepfaking videos on the fly with a background music the sounds like a soundtrack from Hans Zimmer, writing critics about the latest movies in the style of Jules from Pulp Fiction etc... At the end of the day, somebody must pay for the servers and the energy that is required to keep them running. How likely is it, that they will replace all work (and other stuff) that can be done by AI? Can one make such an estimation?

A lot. The training was super expensive in terms of power consumption. \$100 million cost of GPT4 training was mainly for the power and processing.

But at least there are a lot of productivity coming out of generative AI. I am not sure the same thing can be said about crypto currencies which are also hugely power hungry.

So there is a real limit of how widely it can be used in practice. Or an AI will just figure out fusion and get us build the reactors? :-)
