

Inconsistency of carbon footprint in LLaMA 1 paper

Posted by u/secsilm • 0 points • 2 comments

When I was reading the LLaMA 1 paper, it mentioned their power consumption and carbon emitted:

This means that developing these models would have cost around 2,638 MWh under our assumptions, and a total emission of 1,015 tCO₂eq.

However, Table 15 does not state the same information:

<https://preview.redd.it/1b23zuy2pjmb1.png?width=2014&format=png&auto=webp&s=e3fd7eebecd9ffc887a1fdf95bd20aefe903e97f>

The combined power consumption and carbon emitted for all llama models in the table are 777 and 300, respectively. This clearly does not align with the previous information.

Could I have misunderstood something?

See the quote in the paragraph before:

"In this study, we are interested in comparing the cost in carbon emission of training of these models if they were trained in the same data center. Hence, we do not take the location of data center in consideration, and use, instead, the US national average carbon intensity factor of 0.385 kg CO₂eq/KWh."

It's going to be a lot no matter how you slice it.
