

Just Five ChatGPT Queries Can Use 16oz of Water, Say Researchers

Posted by u/Moses_Horwitz • 0 points • 5 comments

Could it be the same pontificating "climate researchers" are also *causing* climate change?

>Researchers from the University of California reckon the growth in popularity of AI might not be without a significant environmental impact. The Associated Press (AP) reported on a preliminary study from the University, which indicates as few as five ChatGPT queries can result in gulping up 500 milliliters of water (roughly a 16-ounce bottle) at Microsoft's Iowa data center. The study also includes indirect water use from other sources associated with the data center, like the power plant that feeds its energy.

>

>Previously, we have looked with concern at the electricity consumption of hyperscalers like Google, Microsoft, and AWS. We also saw cryptocurrency mining operations push computing energy consumption figures to new highs a few years ago. Water is arguably a more precious resource, but California researchers have had to put unexpected efforts into digging up water consumption figures, with AP characterizing server companies as "secretive" regarding specifics.

Water is a renewable resource.

The only water humans "waste" is water taken To space and left there.

California government-funded researchers like these seem best at "What would you like me to conclude".

Someone should tell the Alarmists that water is recyclable. By nature. For free.
