AI Prompts Consume as Much Water as a 16-ounce Bottle Every 5-50 Interactions.

Developing AI models like **ChatGPT** consumes significant amounts of water for cooling supercomputers. Tech giants, including Microsoft and Google, have seen increased water usage due to AI demand.

Efforts to measure and reduce this environmental impact are underway, especially for ChatGPT, which consumes substantial water for each interaction. West Des Moines, Iowa, is an efficient training location due to its climate, but local authorities are pushing for water-saving technology. Microsoft is working with them to address this issue.

NOW: 🤔 Is there a way to reuse this Water? Water used to cool data centers is either consumed, meaning it evaporates into the atmosphere via the data center's cooling towers, or discharged, as industrial wastewater, usually to a local wastewater treatment plant.

There has to be a better way to cool down servers or harness the heat generated to create more energy or for other purposes, right?

This article (link below) shares how certain companies are re-using the heat generated, but it does not seem to be enough.

[<https://www.techtarget.com/searchdatacenter/tip/Data-center-heat-reuse-How-to-make-the-most-of-excess-heat#:~:text=Organizations%20often%20build%20data%20centers,homes%20and%20buildings%20with%20radiators>] (<https://www.techtarget.com/searchdatacenter/tip/Data-center-heat-reuse-How-to-make-the-most-of-excess-heat#:~:text=Organizations%20often%20build%20data%20centers,homes%20and%20buildings%20with%20radiators>).

​

Suggestions? Ideas?

And it takes 2000 litres of water to make one hamburger!

The water is reused...
