

How much did the computing power cost to train ChatGPT 4 (or other large parameter models)?

Posted by u/wittyhi • 0 points • 6 comments

I have looked online but found a variety of answers or answers for smaller ai models. Can anyone give a definitive answer (rough) based on experience/first hand knowledge?

They are not progressing to chatgpt 5 as the computing power is too costly. I suspect this is going to be the factor that allows the big tech companies to catch up with their offerings.

I wouldn't be surprised if big tech or other startups are working on a solution similar to our platform. But as of now, there is nothing like it.

The large computing power costs for platforms like Chatgpt won't be an issue in a year or less.

We could train ChatGPT 5 (compute only) for almost nothing. We just need to bring on some more tech leads to bulletproof our platform (We may do a redesign). Since we are all broke and unpaid, we also need to raise some money and probably ally with a big company so we are not squashed by Nvidia or someone similar.

Dollar cost figures are probably gonna only show part of the story. The opportunity cost, right people, right resources, right time, evolves on a S curve. Welcome the next Industrial revolution.

Right. I am talking about the cost for computing power only. I think we have a way to train massive models for almost nothing. We have tested it on smaller models, but our latest algorithm changes should work for large models

u/Fluffy_Lifeguard_653 • 2 points • 2023-09-25 05:23 UTC

I don't know about computing power specifically but when asked if chatgpt4 cost as much as \$100m to train Sam Altman said "more*".
