

[D] Surge in artificial intelligence power consumption strains US power grid

Posted by u/StreLa1st • 0 points • 11 comments

"The US is seeing a surge in electricity consumption due to the rise of artificial intelligence, putting pressure on power grids. Local utilities have temporarily stopped connecting new data centers due to high demand.

Electricity consumption could triple in the coming years, especially due to the construction of factories to make batteries for electric vehicles and chips. Some utilities are being forced to revise plans to close coal-fired power plants to meet demand. There is also a difficult situation in Virginia, where the state's largest utility company has suspended the connection of new data centers due to a sharp increase in demand.

The US national grid is not prepared for such rapid growth in demand and needs significant investment in new transmission lines and generation. Experts warn of the possibility of power outages in some regions. Despite companies' efforts to use clean energy, factories are increasingly turning to whatever energy sources are available."

Here is a possible indirect solution for the future, if this gets worse, to increase the chances of "singularity" and general development in this area (AI):

1. Consolidation of computing power (GPU/TPU clusters) allows you to create unified large-scale platforms for training neural networks. This makes it possible to train models of much larger size and complexity than a single company could afford. The larger and smarter the model, the better it works.
2. Combining large, diverse data sets for training. The more high-quality data is used, the higher the accuracy of the AI. Together we can create really big data.
3. Reduce costs by sharing computing power and developing common solutions instead of "reinventing the wheel." Saving resources allows you to focus more on improving algorithms.
4. Opportunity for close cooperation between leading experts from different companies. This facilitates faster progress by sharing knowledge and combining approaches.
5. Synergistic effect from a combination of various technologies and techniques. A multi-faceted perspective allows you to find better solutions to complex problems in AI.

You posted all this on reddit, which means you are using a Laptop/Mobile device and the Internet. All of these consume a lot of power too in the US.

Who is reporting a surge in electricity use due to AI?

u/TransitoryPhilosophy • 11 points • 2024-01-29 18:14 UTC

I read the article you posted (and then immediately deleted). It's speculative garbage talking about projections in 2030. This entire "AI is using too much electricity" argument is just doomers recycling anti-crypto talking points

This is an original (my) post and has not been published anywhere (only here). So please, if you are interested, you can discuss something on this topic or even post it somewhere else.
