If we really want all this AI, one approach could be to build the datacenters in space in orbit around the Earth, some thousands of km up, where they can be directly solar powered. In the vacuum of space, solar cells don't need a protective glass on them, so they can be really lightweight. Then just beam the data between the station and Earth with lasers.

Needs further launch cost reductions though.

We're going to need a bigger planet.

No, just innovation to do more with less and all kinds of creative tricks. If we want to keep growing the economy that is.
