

AI already uses as much energy as a small country. It's only the beginning

Posted by u/NuseAI • • 0 points • 91 comments

- The International Energy Agency predicts that the energy consumption associated with data centers, cryptocurrency, and artificial intelligence could double by 2026, equivalent to Japan's electricity usage.
- In the digital age, unseen processes powered by AI impact our lives, requiring materials like plastics and metals with real-world costs.
- Generative AI, such as OpenAI's GPT-3, demands significant energy for training and operations, contributing to environmental concerns.
- AI's energy costs are distributed and lack transparency, with generative AI using 30 to 40 times more energy than traditional AI approaches.
- Data storage, model training, and continuous AI model operation all contribute to the energy-intensive nature of AI technologies.

Correct. AI need to be stopped as quick as possible.

Groq pees over Nvidia for inference. It's probably 90% more efficient.

In Pennsylvania, a data center is being built next to a nuclear power plant.
