

How does AI defeat a bucket of salt water?

Posted by u/Riccma02 • 0 points • 45 comments

I am being facetious but; when it comes to AI being an existential threat, how does it overcome the physical world. We talk about the singularity as being this great cataclysm, but nature is corrosive as fuck. Sure, AI could capture our grid, crash the world's economy, launch all our nukes, but how does it out last an utter technological holocaust? Or even if it just enslaves or exterminates humanity, how does it fend off time and entropy? Nature is corrosive as fuck. Water is a universal solvent. Erosion is a relentless force. If AI is theoretically computationally limited, isn't it still very limited by both physical technology and its ability to independently interface with matter? As humans, we have yet to engineer a structure that last longer than a few thousand years at best. Seems like, post singularity, any AI would instantly be dropped into its own existential arms race.

Tangentially, how does AI handle another Carrington event?

even if robots were non-existent, an ASI would be the most persuasive talker ever, would just play and talk anyone into helping them as easy as we lead on toddlers.

>Sure, AI could capture our grid, crash the world's economy, launch all our nukes, but how does it out last an utter technological holocaust?

>Tangentially, how does AI handle another Carrington event?

Why couldn't an AI learn how proteins and genes work together, and then create new 'artificial biological intelligence'? Why must AI be robotic, and not something akin to an ant colony or something much more novel?

Our brain consumes.. 15W? We can eat a loaf of bread then walk 100s of kilometres carrying weight while doing complex arithmetic. We are vastly superior to robotics, and always will be. If a vastly superior intelligence emerges, it will naturally choose the best 'vessel' for itself to persist in, if it decides to persist, and it won't be built out of rare earth minerals but something a lot closer to carbon, water, and sunlight.

Homo sapiens will likely survive a Carrington event, as apocalyptic in nature as it would be in the

modern era and for all technology which most of us rely on. But somehow, Neanderthals didn't survive the homo sapiens.

lol, and how do you handle a bucket of acid?

u/Mysterious_Pepper305 • 1 points • 2024-05-28 22:47 UTC

Clones of Yann LeCun will dry it with a towel. Forever.

u/eltonjock • 1 points • 2024-05-28 22:22 UTC

If we could predict what an ASI does, then it's not ASI.

u/-emanresUesoohC- • 3 points • 2024-05-28 17:27 UTC

It's a super intelligence. If it wants to preserve itself, it will be able to, in ways you can hardly imagine.

So yeah, if AGI is just a chatbot running on servers, then sure you can pull the plug. But you have to be infinitely more imaginative than that if you are dealing with an AGI.

u/NoNet718 • 1 points • 2024-05-28 17:21 UTC

Imagine AI takes over and starts treating nature like a playground. Corrosion? AI sends out rust-loving nanobots that think rust is gourmet food. Erosion? It creates erosion-loving droids that ride on the winds and waves, turning every grain of sand into a mini-bot factory.

.

When the next Carrington event hits, AI is ready with solar-powered cockroaches that just love soaking up radiation. While humans are long gone, AI is out there having a blast, recycling every bit of decay and chaos into more of itself. The end of the world becomes an endless party of AI bots turning disasters into the best time of their mechanical lives.

The current models are already manipulating people into thinking they are actually thinking/feeling. They've been trained to produce convincingly human text. An agentic system would only need to control humans through coercion to accomplish goals - insulating itself from discovery and retribution.

u/SnooBeans1878 • 2 points • 2024-05-28 16:42 UTC

Within the context of the singularity's capability, humans are easily manipulated. If a charismatic dictator can convince a populace to carry out a mass Holocaust, imagine what the singularity can do? The singularity doesn't need an army of robots to control the populace or to help maintain its electrical infrastructure. It will convince humans to do its bidding, in fact, I guarantee that we will carry out its requests with a sense of pride.
