Ai which use renewable energy

Posted by u/Optimal_Ad988 • 0 points • 5 comments

I'm concerned about overusing ai, and the amnt of electricity it uses. Does anyone know of any AI assistants which use renewable, clean energy sources to power their microchips? Also, I know that millionaires and billionaires produce more carbon emissions than everyone else, so don't be smart with me. I can't seem to find anything, but you all must be like the grandmasters of AI, which is exactly why I came here. Thank you, in advance!

Several datacenters, mostly in Europe, run on 100% or 95%+ renewable energy on [Google Cloud] (<https://cloud.google.com/sustainability/region-carbon>).

So I guess running an AI on a GPU server in these datacenters would work. It is a technical setup though.

On the more theoretical side and looking farther ahead, when the earth's energy problems become severe enough, even the millionaires and billionaires will need to start doing things right. One way to do things right is with reversible circuits, but so far not enough people are interested in this scientific direction to fund it or to research it. It's admittedly a tricky problem, but it is theoretically possible, and would solve virtually all the problems of computers generating heat, with just a single breakthrough idea.

Reversible Computing

My Mac runs off a solar panel setup and both my AI tools (LLM and generative imagining) are entirely local. So entirely renewable power.

What's your loan AI LLM?

u/NYPizzaNoChar • 2 points • 2024-06-15 23:51 UTC

> What's your loan AI LLM?

local, I guess you mean?
