

Why is the energy consumption a big argument in the anti AI crowd.

Posted by u/bowobear • 0 points • 5 comments

Out of all of the anti AI points that can be made I see its use of energy as a big one. A recent example stated the google ai uses 3watt hours which to my first guesses Dosnt seem like that much, especially when googling and seeing the average house uses around 26-33k watt hours daily.

>the google ai uses 3watt hours

Yeah, that never happened

u/Cliffy73 • 1 points • 2024-06-28 02:49 UTC

Yeah, but houses provide something with social utility.

The honest answer is that people are scared of the future.

It's true that AI uses a disproportionate amount of bandwidth vs. what it gives, but that has always happened. If someone doesn't understand how AI will change things, then they are either purposefully naive, or have an agenda.

Its not a big deal if you look at one computer using AI. If you look at a data center, its huge. Estimates 800-1000 terawatts by 2026

>Research by PhD candidate Alex De Vries found that the rate at which Google's AI is growing could see it consume electricity between **85-134 terawatt-hours (TWh) by 2027** – which is roughly the same annual energy consumption of a small country.
