

AI emergence will DOUBLE energy consumption in U S. alone. Solution:Hedera Hashgraph

Posted by u/Impossible-Goal3492 • • 0 points • 12 comments

It is widely expected that the prevalence of AI in the economy will double energy consumption in just the USA, not even factoring in the global economy

As old heads look to increase energy production, it seems like the financially & environmentally responsible thing to do is utilizing modern technology to DECREASE energy consumption to save money & drastically decrease a companies carbon footprint, which will eventually matter A LOT when Carbon Credits become global norm.

The answer to this pressing & critical dilemmas is hiding in plain sight with the industry leading Hedera Hashgraph's DLT cutting edge technology which various credible studies have shown is the industry leader when it comes to sustainability & energy consumption. By a long shot. In fact, it's not even close.

As legacy companies in EVERY sector adapt to the 4th industrial revolution led by AI and the shift from web 2.0 to web 3.0 it is mathematically possible to actually see a reduction in energy usage opposed ro a 2x increase.

In a world where AI tech is imbedded to semiconductor chips powered by Hedera Hashgraph we would have trillions of electronic devices consuming a miniscule fraction of what they would consume on other ledgers.

Energy consumption which is directly related to cost per transaction will be the leading factor for DLT adoption in the future as energy prices expect to continue to rise as they always have

Semiconductors are the new 'oil' and DLT tech will be what fuels them as a new form of 'gasoline'

The solution is so simple: Hedera mass adoption will save the planet & economy in the long term.

Hedera is a ledger. It has no influence on the computational processing or the graphics processing methods, the energy output of server farms, or the methods they may use to reduce their consumption.

But as Leemon so eloquently put it: "The best kind of energy is the energy you DON'T use".

u/Ricola63 • 2 points • 2024-08-22 08:33 UTC

This post seems a little off base to me.

1. AI, per se, is obviously not Blockchain/ DLT. While the two complement each other one is not a substitute for the other.
2. Hedera will technically reduce carbon emissions from Blockchain/DLT activity - but this is likely only a portion of the AI likely energy consumption identified by OP.
3. What Hedera makes possible however is an environment where the users of the AI are properly charged for such usage. Which in and of itself is likely going to be a major part of solving the issue of excessive carbon emissions. If we move to a world where energy usage is properly and fairly accounted for, then this will have an impact on the problem. Such a change however goes well beyond technical capability - it enters the domains of legality and politics (International politics) - which is much harder to crack- although Hedera may well reduce the friction of such changes as well.

Yep, OP's post is off base.

Hedera is a ledger. It has no influence on the computational processing, the graphics processing, chip architecture, the energy output of server farms, or the methods they may use to reduce their own energy consumption. If anything, Hedera would work in tandem with AI processing units and only add to the total energy output.

But as Leemon so eloquently put it: "The best kind of energy is the energy you DON'T use".

Cutting edge technology? AI is more cutting edge than hashgraph. Hashgraph is just a service byproduct provider for transaction. You don't need hashgraph to run AI if they don't feel like it

u/CertainMiddle2382 • 1 points • 2024-08-22 08:05 UTC

You cannot double energy consumption because there is no double energy production.

It will just increase the marginal rate of electricity towards marginal ROI of AI...

u/simulated_copy • 3 points • 2024-08-22 00:37 UTC

Hedera is not AI

Full stop!!

Could you not use Ai to write this...

u/Citadel_Employee • 2 points • 2024-08-21 21:29 UTC

The main share of energy consumption will happen during the training of the models. This problem is solved with more efficient hardware, and better learning algorithms. This is a separate issue of Hedera/crypto in general.

As the other commenter mentioned, the models themselves are too large to store fully on a dlt.

u/Professional-Ad-9055 • 9 points • 2024-08-21 19:32 UTC

It makes no sense, the cost to run an AI is not related to the transactions, it's related first to the training process that requires a lot of power to run thousands of GPUs, and second to run the AI model itself, that requires a very robust server. Nobody will run an AI model in a Blockchain or in a hashgraph or whatever. The best they can do is wrap some API call in a smart contract and call it a crypto IA, but that's just dumb or a scam.

u/CryptoCreisi • 3 points • 2024-08-21 22:18 UTC

Precisely. Another post of crap to entice novice retail investors when in actuality, the entire post is nonsensical.

u/DatTrackGuy • 1 points • 2024-08-21 18:53 UTC

How the fuck does a DLT reduce companies expenditure on compute?

What are you smoking bro lol.

I say this as probably one of the largest holders of HBAR out here, post like this are pure cancers because they are so chocked full of shit that it deters people with actual brains from investing
