

How much power (Watts) are local LLMs like Llama 3.2: 1B & 3B using on mobile devices?

Posted by u/deebo_5 • 0 points • 4 comments

Anyone used the new Llama 3.2: 1B & 3B on an iPhone/android? I'm trying to understand how local use of LLMs might impact battery requirements for mobile devices.

iPhone 15 pro max batteries are currently ~17 Wh.

Would appreciate any thoughts on how much room there is in the near future for reducing power consumption with little cost to model accuracy/usefulness.

Usually it is a full CPU load, so basically it depends on your CPU chip.
But in general it eats battery like a 3d game~.

I checked, 3b is something like 2a draw while generating on my xiaomi 13.

I would say probably much lower than what they currently used to run something like ChatGPT but for now running LLMs on your iPhone will drain significant amounts of battery
