

**With the (near useless) AI overview that is created for every google search, is using ChatGPT really that much worse for the environment then just googling something? Especially when you consider how unoptimized Google's search function has become, causing multiple searches to answer a question.**

Disclaimer this isn't me trying to make a case for or against.

As someone who grew up in a remote northern area that is currently being gravely effected by climate change, I've always been a very Anti-AI Pro-AI-Regulation type person ever since reports about it's energy use were becoming public. Up to now, as to stick my stance, I've sparsely used ChatGPT, having not even touched it in the past year.

Unfortunately as of now it feels almost unavoidable to use AI. You want to google something and now you have to deal with an AI summary, you click on the websites and it's written with AI, the pictures are created using AI, and it seems every other website seems to boot up an AI chatbot automatically.

If I'm going through all this AI to avoid using AI, then am I really doing anything or am I just being stubborn?
