

Majority of people are still uneducated about the amount of power being used by AI to generate an image.

I can't count how many times i see an AI art and its filled with a comment "erm AI is bad for environment because it takes 1 bottle of water per image generation since it needs alot of powers just like cryptocurrency". The reality is, it only takes a very little of electricity to generate more than 1000 image per day and your fridge + 4K TV + AC/Heater literally takes more power to run.

I think the problem is, everyone keep using that news about OpenAI as a proof of AI power consumption. This argument is debunked and need to be spread everywhere to combat misinformation.

This sub and everyone in it is a pretty good indication that we as a species are fucked.

A friend who always needs rides (she can't afford a car) got mad at me for using ai to make concept art for a project I'm making by my own human hands. She told me I'm killing earth, then asked for a ride home in my EV. I crunched the numbers - giving her a ride was equal to 16,500 AI generated images. She called an uber!!!

Yeah, and because it's so much faster than traditional digital art, per image it uses ****less electricity**** than would be consumed by Photoshop / Procreate / Clip Studio / Krita.

Yes, it uses more power (more energy per second), but because it completes the works so much faster it actually wins the total energy consumed game. One minute of AI generation can equal multiple hours of work in a digital art app.
