

How does using AI on websites use up more water than regular computer usage?

Posted by u/ubcstaffer123 • 0 points • 3 comments

I read that AI takes up a lot of water and energy. But ChatGPT and other AI sites are operated on a computer or mobile device. How does that use up more water than other computer functions?

You are not running AI on your computer or mobile device, your device connects to a enormous amount of servers need to operate the AI applications.

The places that house these servers need electricity to run them and a cooling system so they don't overheat.

AI requires a lot of processor power. Any other calculations that used the same amount of power would require the same amount of cooling.

ChatGPT is not actually running on your mobile device. Your mobile device is just communicating with a server farm where massive computers are being used to actually generate the responses. The mobile device just sends the info out and receives it.
