

BUSTED! Sama says AI consumes less water and it was all a hoax by anti-AI activists (2 images)

Posted by u/HyperspaceAndBeyond • 0 points • 370 comments

The water consumption by datacenter by AI is not that high at all. 1 hour of TV in the US uses 4gallons of water, while 300 queries of ChatGPT is only 1gallon.

Leaking pipes in US exceeds more water usage than the total usage of ChatGPT by all subscribers and free users globally per day.

So anti-AI activists lied? Or was it all a misunderstanding? You be the judge.

How how many queries would be being performed when ai is common place to solve complex problems even if this were true

Then add the resources to construct the hardware

u/john_br0wn • 1 points • 2025-02-18 20:54 UTC

I don't see how the water is consumed here. A water cooled PC has a flow rate around 0.3 gallon per minute, so it doesn't seem out of reach to assume that a couple of H100 are cooled with 1 gallon/m while processing the queries. But the water from the cooling system is in a loop, it is not gone. So how is it wasted?

Right, non-vegans use so much water it's fucking insane

Since it costs literally zero water to run a TV I have no idea what is actually being compared. Are we just counting the amount of water used in the power plant to generate the electricity? A 65" TV uses 100-250W according to Google. Hard to make sense of what is actually being claimed.
