Data Center Energy Use: Charting the Projected Rise

Posted by u/Adventurous_Motor129 • 0 points • 1 comments

Growing from 4% of all power required in 2023 to 12% by 2030...quadrupling in power required, just for data center server farms.

I think it will be more than that, because there will be need for the digital currencies usage and digital surveillance governments want to do recording/storing/recalling everything you say, everywhere you go etc. Saying massive computational power requirements is not an overstatement. You can easily see where this is going with your carbon footprint and a shift into 15-minute ghetto solutions.
