AI Could Consume 99% of the World's Electricity?! Eric Schmidt's Shoc...

Posted by u/kissthesky303 • 0 points • 4 comments

If AI gonna use 99% of the currently available energy, we would need to casually double the output, so are we just ok with that because AI is worth those efforts? Or do we create economic and environmental risks which does not justify the potential benefits?

Before I start freaking out, and believing everything I read on the Internet, I will do a bit of research first. I really am skeptical that AI is going to take 99% of the world's electricity by 2030, that is just ludicrous.

That is the problem with the web, remember the entire covid ordeal, and people going crazy over TP? 99% of electric power sounds as goofy as vaccines injecting nanobots into us, and us being mind controlled by the 5g towers.

So we need to increase capacity by about 5%

Current American capacity is roughly 1250 gigawatts. Given how little of that is nuclear and how much of that is coal, I think that's feasible.

I have no idea where they are getting the 99% power figure as AI doesn't even account for 5% of just total data center power consumption.
