The AI use water? What are we talking about?

Posted by u/BlameDaSociety • 0 points • 108 comments

****What kind of server that require a constant need to exchange coolant fluid like steam engine?****

I've been on server room, and I worked in IT industry, the truth is, you don't need to change coolant that much. ****It's basically just car radiator you need to change once a while.****

And if you talking about open loop system, you basically pump water from river, then put away the heated water back into river.

Yes, the water is hotter than it was before sure there will be environmental hazard from the electronics, but that's about it. This is no power plant. I won't say there's no radiation, but comparing radiation from power plant vs server rack is like... ????

Or just use coolant server style instead.

Please teach me about these so called steam engine server?

Solution: put data centers before waste treatment plants where it'll get treated and allowed to bleed energy to the air and put them by drinking water intakes. The water is going to become gray water anyways

u/BlameDaSociety • 1 points • 2025-05-11 23:14 UTC

Best solution: yes, move to water treatment plans and use gray water (cleaned good enough as gray water) to vaporizer.

The other solution is using liquid cooling instead of air cooling. However, liquid cooling needs constant monitoring, since it's bad if something leaked from server.

The 3rd solution are move somewhere cold (Canada), or use sea to cool down the heat.

>A server operate around 15°C, meaning the whole room is cold as winter.

As a Canadian this makes me chuckle. It's 15c in may right now

On topic, while the water is used, it's not destroyed. It goes back into the water cycle. The real problem is how much water use can a region support. That's why farming in Californian deserts is an issue because the people that live there need water too. But the crop is valuable so they drain the aquifers faster than they can refill.

This is why it's a good idea to build these data centers next to readily available sources of water and to use that water in a way that is ecologically sustainable. People just spouting off about water use (heh) don't really understand why it's a problem and where. They've come to believe that all water use is wasteful and that the water is gone forever.

There is a high level of naivety in the criticisms against data centers.

Some datacenters are even used to warm water so people have warm water and heat at home.

Yes, i personally drink a full bottle of water every time i generate an image locally on my pc.
