The world is SCREWED, Math professors are now using AI in their research, 200 LITERS of water were used in this project alone!

****Terence Tao, one of the greatest living mathematicians, using AI in his research only means one thing:****

AI is a useless fad and any day the bubble will explode and all AI companies will go bankrupt and the planet will be healed and global warming will stop

Many physicists would call you a moron, and I would agree with them.

Producing just one kilogram of beef requires over 15,000 litres of water. Meaning, ****3,000 litres**** of water are needed to produce one 200-gram dinner steak.

Ask any human a pop math question and the results are the same. They get mad at you.

Yeah duh, it is now part of basic scientific computing classes and things like lean exist too

Weve been using ai in research for years, unfortunately the recent boom did not bother to include sustainability in its design, which is indeed a problem, but not specific to new ai, more of a general dependency on limited resources overall
