

What are the prospects for significantly reducing the energy consumption of artificial intelligence in the future? Are there promising developments aimed at making AI much more energy-efficient?

Posted by u/mitsu85 • 0 points • 2 comments

I'm shocked by how much energy is consumed when interacting with AI, especially whenever I read articles about it. Are there any possible improvements in the future to reduce this? For example, better algorithms or more energy-efficient hardware?

We know that human-level intelligence can exist using around 10-20kCal per hour. So there is a lot of opportunity to discover more efficient models. We should eventually be able to close the gap or even improve upon this.
