

If AI servers require so much water for cooling, why don't we build the servers in the Arctic?

They should build them in Iceland. Unlimited geothermal power potential, close to continental Europe, plenty of boulder fields where nothing will grow ideal for industrial buildings that are close to places of stunning natural beauty.

Lack of infrastructure. Better idea : use heat generated by server farm for district heating.

u/MaTr82 • 2 points • 2025-06-09 11:06 UTC

Data centres in cold countries already use the environment to assist in cooling.

It only causes problems. The machine is too hot, so you need to exchange heat with the environment. The best way to do that is to take cool fresh water and run it directly through the facility, and turn it into warm fresh water. This does work better if the water is especially cold. But if the water source freezes, the whole thing stops working entirely.

Why they don't bring the Arctic closer .

Why is it so damn far away .

u/Skatingraccoon • 1 points • 2025-06-08 23:38 UTC

Well, you've got the cooling there, sure. But now how are you going to actually power that and then you gotta spend money to link it up to the rest of the world.

u/OstebanEccon • 4 points • 2025-06-08 23:36 UTC

insufficient power, insufficient internet connection
