

How bad is AI for the environment really?

Posted by u/Unalivem • 0 points • 37 comments

I enjoy talking to AI a lot, lots of interesting conversations and stuff, learned a lot (obviously know AI can make mistakes and all that I am conscious) but I've heard it's "extremely" bad for the environment. How true is this? How much impact does me using AI regularly actually have? There's so many things we do daily that are bad for the environment. Is it worse than buying fast fashion or driving? Are there any other aspects? I love AI, it is fascinating but I'm obviously willing to give it up if it's actually harmful.

A IA tá sendo vendida como solução global, mas consome mais energia que países inteiros. Me explica como isso é sustentável ou inteligente?

A čo ja viem ved' sa pýtam klud. A skadial máš že konzumuje viac energie ako krajiny? Daj source

This is a pretty big thing in the news these days. By using AI you generate demand, which in turns means more computers dedicated to AI in data centers. Which use electricity. But everything we do has an environmental cost. Googles searches cost less than AI in electricity but they cost something, and we've all been googling for decades now.

Cryptomining is apparently still a far larger consumer of electricity than AI. If you want to get mad about something, get mad about that. It's completely nonsensical, total insanity. It produces nothing except magical numbers for people to speculated on their value.
