

Some context to consider in relation to the posts about the environmental impact of AI

Posted by u/AtuXIII • 0 points • 2 comments

Most of my social circle has jumped on the anti-AI bandwagon, to the point where it's taboo for me to even mention that I use it. One person recently shared an image about how each query to ChatGPT uses about a half liter of water and enough energy to charge an iPhone 7-8 times.

While this may be true, I found myself wondering how this compares to other tasks we do every day. I found that a moderate day of usage consumes about the same amount of water as flushing a low-flow toilet once (let alone a standard toilet, which uses much more), and about the same energy as doing your dishes or running a washing machine.

In fact, you can offset your AI use (or at least I can) by being better at turning off your lights and spending only one minute less in the shower. It seems to me that it's not too bad in the scheme of things.
