

# Does anyone us AI in a production environment? That is not a chatbot?

Posted by u/Key-Singer-2193 • 0 points • 16 comments

I am curious to know this. Especially with MCP servers. I don't see any use for an mcp server in production

Dev, yes of course. Using MCP to connect to firebase or postgres works wonders.

However for normal production, Imo AI brings too many dynamics and can go off the rails quickly. We tried to use AI for some application and by the end of our development testing we literally had a 5 page document with nothing but prompts. Prompts for safeguarding and prompts to safe guard the safe guarding.

In the end the project became in the red because AI brought too much dynamic value in responses and couldn't be reigned in enough to make it worthwhile vs the more stable approach of static values through apis.

One hallucination in UAT caused an uproar. Partly because the company wasn't onboard with A.I to begin with calling it a "FAD"

So other than chatbots has anyone found real use for AI in production?

My team creates ai agents in slack that connects to jira/linear/asana... and automate lots of daily tasks there. Since we have coders and non-coders in the team, sometimes it's hard to sync all the progress. Therefore, we built agents that can give us daily jira/linear updates in slack convo. Or when we are discussing something in the chat, I can ask it to create an asana assignment for me without needing to switch tools.

Note: one of the founder and happy to share more if anyone is interested!

If you mean by ai an llm, then basically we use it for many language related tasks. I think it depends on what you use what for, if you simply only use ChatGPT, yes that is optimized for a chatbot. But api is not optimized for chatting as much.

u/pulse77 • 1 points • 2025-07-07 19:40 UTC

Many people use Google Translate in their daily work and it is not a chatbot. Google Translate is built on GPT (GPT was invented in Google Translate team).

u/Trotskyist • 1 points • 2025-07-08 07:12 UTC

> (GPT was invented in Google Translate team)

well, not quite. Google's team invented the transformer architecture in 2017. A year later, OpenAI team took that and combined it with another technique, generative pretraining, to create the generative pretrained transformer (i.e. "gpt") which is the basis for all modern llms.

We're using Gemini to provide contextual data in our app, however all the data is pre-fetched and a sample is manually reviewed.

u/Maleficent\_Mess6445 • 2 points • 2025-07-07 04:13 UTC

I think that's right. MCP is of no use in production and can be counter-productive. API is the proven method. However I think most applications will have some form of chatbot for user interaction.

u/ggone20 • 3 points • 2025-07-07 03:40 UTC

Yes. Lol for decades now.

**u/AI\_is\_the\_rake** • 1 points • 2025-07-10 10:00 UTC

You've used MCP servers for decades? Impressive. Innovative. You must be rich.

**u/ggone20** • 1 points • 2025-07-10 15:59 UTC

Was a joke silly. Title is 'AI in production'.

AI has been around, in production, for decades. I did my thesis on machine learning for financial markets almost 2 decades ago. So yes. Decades.

Take a joke.

**u/istarisaints** • 1 points • 2025-07-10 21:28 UTC

Do you not make a distinction between AI now and AI decades ago?

Regardless if you do there is one and this kind of AI hasn't been around for decades?

Or would you disagree?

I used to use [Claude.ai](http://Claude.ai) for several tasks. Mostly interface changes on vyatta firewalls.
