

Data center boom in Georgia sparks water worries and resident backlash | TechSpot

Posted by u/musing2020 • 0 points • 4 comments

"The issue isn't unique to Georgia. Across the country, the proliferation of data centers is straining water supplies, especially in regions already grappling with drought and water scarcity. Some estimates suggest that large data centers can consume up to five million gallons of water per day. As AI applications become more widespread, the global water footprint of data centers is expected to double in the coming years."

This is the Georgia with peaches, not the Georgia with the breakaway republics along the Russian border.

Georgia gets plenty of rain. It's already build several man-made lakes but it needs more because the population has grown. This growth opportunity looks like a perfect excuse to spend the money it needed to spend anyway to build the new lakes required for more DCs, and just to have water to use.
