

What work is being done to make AI more energy efficient?

Posted by u/ElectricalPianist649 • 0 points • 4 comments

I know it's very energy inefficient. All the discussion I see on the issue is saying "it's awful that it's bad" and stops there. Computers themselves were really inefficient when they started in the first place, and they've gotten much better. So, I'm assuming they're working to make AI more cost effective and efficient too - what's being done?

Reducing costs is something that all companies always strive for. So they are constantly trying to make AI less demanding in terms of energy and chips used.

Big data hubs and energy grids to support them. Statistically in the US, your average energy grid is over like 40-50 years old.

Already bordering serious issue just with growing populations and stuff with outdated energy grids. US seriously needs to update energy grids nationwide and preferably sourcing stuff not from China. Which currently isn't much the case

So just "more power makes better ai" not "use less power"? Or minimizing loss due to old grids and increasing efficiency that way?

I am far from an expert on this topic. My only applicable, or somewhat applicable insight is that AI and growing data bases uses a shit ton of energy and Americas energy grids are already in trouble.

Adding more to them without much update no matter how efficient AI, and everything "tech" on top of it, such as just electric vehicle charging ports, is a bit of a problem.

Idk how much more efficient AI will become, but overall we need updated and better energy on top of, or along side things like AI
