

AI searches consume a lot of energy, but now that even normal search engines incorporate AI, does it even matter what we use anymore?

Posted by u/plumplet • 0 points • 3 comments

So I used to use ChatGPT as “quicker and more efficient Google” back before I knew how much energy it cost for just one search using AI. But now even Google and other search engines are incorporating AI as the first search that comes up. So my question is does it even matter what we choose anymore? They make the choice for us and the energy gets wasted anyways.

This whole attack on AI for power and water use is basically just political nonsense.

Are resources used? Sure, to a point. Does your participation make a difference in any way? Not even remotely.

Almost any task an AI is being utilized to accomplish would take **more** resources if not using AI, unless it is malfunctioning and repeating the task without end.
