

Data Center Consumption - an internal look at Water Usage, Data Storage, AI and More 💡💻

Posted by u/beaniesandbootlegs • • 0 points • 0 comments

Hi Reddit :-) I hope everyone is having a great day/night!

Today, I wanted to open a productive conversation about Data Centers and the impacts it has on the Environment 🌊⚡

Currently, as most of us are aware, Water is consumed by AI. That is an important one, but there's so much more to the story.. Data Centers (which r used for internet searches, phone and computer data storage, etc.) use this water to cool the internal system's technology. As more and more queries/data pours in, the thirstier that technology becomes.. contributing to Global Water Scarcity, especially in Water Scarce regions and Drought-Prone environments. Many experience the impacts daily, some with little to no water in their lives.

And it doesn't stop there, the environmental impact are also influenced by the production of Food, Fashion, Fuel and other Industries in our society.

So what do we do? Do we Abandon burgers, jeans and AI?

❌ No, instead I believe Mindfulness and Regulation go hand in hand. 🧠 Educating ourselves and Considering/Keeping Track of How much we Use these products, as well as What For.

Today, companies are working on solutions to the water crisis.. and that will take time, energy, money and other resources, which are other things these products have influence on. Feel free to be part of the discussion and comment any intel, or concerns with me in the comments 🙌🙌🙌

Alternatively I'd also like to add that if you wish to not use AI, and want a Environmental-Friendly Web Browser that donates to the Ocean, check out OceanHero (free for download on Mobile Phones, and for Desktop Computers, simply look it up and copy and paste the URL to your desktop. Happy Surfin' 🏄)
