32% of the Colorado river is used to grow feed for the animal agriculture industry every year which is over a trillion gallons of water. AI water use doesn't even come close.

There seems to be a lot of discussion surrounding AI water use online and in the headlines.

Whether or not you like AI, let's be accurate about what is actually impacting our planet and resources. The energy it requires to run AI is a drop in the bucket compared to the damage animal agriculture does on every metric.

It took **2.8 million gallons** of water to train an AI model (LLaMa 2) one time which caused Business Insider to write an article titled: "[Llamas don't drink much water. Meta's new AI version is damn thirsty.](<https://www.businessinsider.com/meta-llama2-ai-uses-almost-twice-water-as-llama-2023-7>)" They go on to write that the state is running out of water.

Meanwhile it takes 1.6 **trillion** gallons to grow alfalfa **every year** from the Colorado river which exclusively goes into feeding cattle. I said **trillion**, with a T. You could train a LLaMa 2 AI model **every single day for the rest of your life** and you'd die before you even come close to that number.
