👁️ Musk asked Zuckerberg to join \$97B OpenAI takeover

- * Elon Musk asked Meta CEO Mark Zuckerberg for help financing an unsolicited \$97.4 billion offer to purchase OpenAI, according to a court filing from the AI company.
- * The document reveals neither the chief executive nor his firm signed a letter of intent, ultimately declining to join the bid to purchase the ChatGPT maker.
- * OpenAI now argues this secret request to a main rival weakens Musk's legal claims that its Microsoft partnership violated the organization's original charitable mission.

🔴 Nvidia halts production of H20 AI chips for China

- * Nvidia directed suppliers Amkor Technology and Samsung Electronics to pause manufacturing of its H20 chips for China, following a government order for local tech companies to halt purchases.
- * This directive comes as China's Cyberspace Administration reviews the H20 chips for security risks, specifically

concerns that they might contain "backdoors" or tracking technology for remote operation.

* The move casts doubt on the chip's future in China, even after Nvidia CEO Jensen Huang worked to secure US export licenses and assured Beijing the hardware has no "backdoors."

🔄 Bank rehires workers replaced by AI after "lying" about chatbot success

* The Commonwealth Bank of Australia fired 45 workers, claiming its new AI chatbot had reduced call volumes by 2,000 a week, a statement employees called "an outright lie."

* In reality, call volumes were increasing at the time, forcing the bank to offer staff overtime and even have management help answer the phones just to keep up with demand.

* After being brought to a fair work tribunal, the bank admitted the roles were not redundant, apologized, and offered to rehire the workers or provide them with exit payments.

🏠 Google launches Gemini for government at 47 cents

* The General Services Administration announced that federal agencies can now access Google's suite of artificial intelligence services, called Gemini for Government, for only 47 cents each through 2026.

* The GSA previously added Google's Gemini, OpenAI's ChatGPT, and Anthropic's Claude to its purchasing system, following moves by competitors to offer their AI products to the government for \$1.

* Building on a past discount for its Workspace tools, Google's new offer gives federal employees access to tools like NotebookLM and Veo, which are powered by its latest models.

* The AGI Foundations team is being scattered across departments, with Meta also creating a 'TBD Lab' to explore

“omni” models and frontier AI research.

* Wang revealed that Chief Scientist Yann LeCun will now report to him as well, describing FAIR as the “innovation engine for MSL” in the new structure.

****Why it matters:**** Meta’s summer of hiring looks to be officially over, with the focus now turning to building a new internal structure under the direction of Alexandr Wang. It’s clear that the high-profile new team wants to move fast — what isn’t clear is how the changes will sit with the broader AI and FAIR teams that now feel lost in the shuffle.

* Researchers criticized the study for ignoring water consumed by power plants that generate power for data centers, which represents the majority of usage.

****Why it matters:**** While Google’s efforts to provide more transparency around AI’s environmental impact (a key issue for AI detractors) are positive, not everyone agrees with the company’s process, which may be painting an artificially rosy outlook. An industry-wide third-party standard may be needed to truly understand the full picture.

****Why it matters:**** AGI is a benchmark without a very clear definition, which will make the first official declaration of it all the more interesting. With OpenAI being the other major lab dancing around the notion of its models officially reaching the bar soon, the term could end up being the topic of the next inevitable feud between Altman and Musk.

💡 Your Gemini prompts likely consume less energy than you think—Google transparency raises questions

Google claims its Gemini AI uses just ****0.24 Wh** of electricity** and ****0.26 mL of water**** per text prompt—energy equivalent to watching TV for nine seconds and a few “drops” of water. Despite impressive efficiency gains, critics argue Google's estimates are misleading, citing omissions like indirect water usage, location-based emissions, and the rebound effect of overall increased AI utilization.
