

Can someone explain to me how exactly AI is bad for the environment?

Posted by u/tiinybmbblebee • 0 points • 52 comments

I don't really comprehend how its any worse for the environment than any other technology like phones or any other websites or phone apps. Please explain it to me like I'm five. (This is not me saying I support AI or anything, I just want to know how exactly it is bad for the environment) Trying to learn without being judged.

Electricity. AI needs a permanent supply of electricity, so toys like solar and wind are insufficient. I'm pretty sure the electricity demand by AI will accelerate the transition to new nuclear, but until then, it means more coal burning.

Thus, it's a two-edged sword: short-term, more use of coal, so more air pollution *and* more CO2, long-term more nuclear, so more clean energy for everyone.

You're burning fossil fuels to replace humans in the workforce, except the humans don't just ****VANISH**** when they get laid off. Instead they go on public welfare programs or charity. So the human is still there, consuming resources, while the job they used to do is being done (badly) by a computer program powered by fossil fuels.

like Bitcoins and other useless things,

AI is using up the planet's resources to achieve very little
