

Imagine using a Microbial Fuel cell that intakes human food to power AI?

Posted by u/Ok_Blacksmith2678 • 0 points • 8 comments

Everything needs energy to function.

AI runs on electricity and humans run on food (That is converted to energy)

Can an MFC (Microbial fuel cell) be given food as an input to produce energy to run robots?

This way, Robots or AI is not dependent on electricity that humans control and can actually make their own food and live on forever?

VERY RANDOM THOUGHT - was wondering if you folks have some knowledge on this?
Read more about - EATR (2010) and MFCs

Electricity can come from any other number of sources that humans cannot use for sustenance. There is absolutely no reason to use a resource that is vital to humans and already sometimes scarce to divert to a new purpose. Food *waste*, on the other hand, can be used in bioreactors, if it is not practical to use for composting.

u/Txcavediver • 7 points • 2025-08-29 13:47 UTC

Maybe we could find a way to use humans as batteries that power the AI. We could even come up with some sort of program to keep the humans happy while keeping them in a coma like state.

I'll have the red pill, please

Or, they can just have a solar panel / wind turbine to use the energy that is constantly coming to the earth from the sun. That would make it much more efficient than the way we gather the energy from the sun (by eating photosynthetic plants or stuff that eats them).

u/agma0013 • 6 points • 2025-08-29 13:37 UTC

sounds at best inefficient, but worse it sounds downright dangerous.

We are struggling to feed ourselves, why would we want robots to compete with us over food sources?

u/bufalo1973 • 1 points • 2025-08-29 15:12 UTC

Even worse: we can become the next item on the menu.
