

Google Reveals How Much Energy A Single AI Prompt Uses

Posted by u/energysage-official • 0 points • 84 comments

Google just pulled back the curtain on one of tech's best-kept secrets: exactly how much energy its Gemini AI uses with every prompt. The answer—0.24 watt-hours (Wh) per median query—might seem small at first (about the same as running your microwave for one second). But multiply that by billions of daily interactions, and it suddenly becomes clear just how much energy AI is really using every day.

Multiply the billions of microwaves running for minutes on average every day. And I think microwave ovens is not even something that registers on electricity usage compared to things like HVAC, lighting, transport, industrial use, etc.

Thank you again for proving that the electricity usage of AI is basically a no issue in the greater scheme of things.
