

TikTok's building a massive data center in Brazil that'll suck up 30,000 liters of water every day

Posted by u/davideownzall • 0 points • 66 comments

A mega data center, millions of liters of water at risk, ancestral lands trampled without any consent: the Anacé Indigenous people denounce what they call a true colonial "land grab" in the name of TikTok.

Cooling systems in data centers or other industrial facilities have a set amount of water that's circulated through the pipes. What this means is that there will be 30,000 liters of water moving through the system as needed, not that 30,000 liters of water will be pumped into the pipes each day and then disappear forever.

It's not the quantity of water in itself, since 30k Litres of water is not that much really as it seems from the number itself. It's how they behave and how they don't care about nobody.

In Ireland we pay extortionate electricity rates because of these dickhead data centres. Fuck this way of life.
