

Ai servers are bad for the environment, but why not normal servers?

Posted by u/mushroomforest_ • 0 points • 49 comments

Im posting this here because i don't really know where else to put it. To be clear, I agree that ai is bad, especially ai art, voices, stuff like that that take away creative jobs or trick people into thinking something fake is real. But I see a lot of people say one of the reasons it's bad is that it uses a lot of water for cooling, which negatively impacts the environment. The thing that confuses me is don't all types of servers use water for cooling? Why is this just a topic when it comes to AI and not servers in general? Is it that AI uses more water? I genuinely want to know so if you have an answer comment it below

AI is not bad, nothing is black and white. There's a gradience to it.

People specifically say it's harmful due to its power consumption because of how much power it consumes at scale. Another big one is that the US power grid is very old and without repairs and with increasing workload for AI we could see a blackout that could takes months or years to fully recover from. Think, no power whatsoever anywhere in the nation.

Electricity is bad for the environment, we should live in the dark!

Come to think of it, humans are bad for the environment, we should go extinct!
