

Can I get some info about how AI isn't ruining the environment?

Posted by u/HyperTerrestrial • 0 points • 30 comments

Or isn't completely oversaturating the Internet, and on its way to becoming the biggest propaganda machine?

I see AI generated photos and videos, and I see nothing ethical about them. The recent Jake Paul videos looking so real with Sora AI... Does that not make you guys the least bit disturbed? Or am I missing something?

I need facts because literally I have been getting harassed online by furries because one found out I use AI

u/Fakeitforreddit • 2 points • 2025-10-08 23:21 UTC

Its like 15% data center usage, which is 40% of the digital tech industry which includes television and film, all data centers, rhe internet, tech manufacturing etc. Its consistently misquoted as if it is the entire digital tech industry to make a point by people who do not care about factual accuracy.

Saying this one thing is killing the environment and picking somwthing that represents a fraction of a % of humans environmental damage is asinine.

So putting aside you just being wrong about half your belief on something. If you engage with reality in a way that you only see AI slop everywhere then you spend way too much time on social media because thats pretty much where all the slop is and the easy solution with that is to stop doing it. A day where im engaging with music, books, movies, or video games has never encountered AI slop to this day. Then there is this massive place called outside that place is devoid of AI slop especially the nature part of it. Thats the majority of my life and where my attention goes and I see very little AI outside of my own use of it or the hilarity on reddit.

Every comment and aspect of the environmental topic strikes me as a string of hallucinations on display. But you who are so concerned about such matters keep on keeping on.

It requires thinking and talking in circles to justify the greatest power expenditure on the planet at a time when half or more of power depending on region is still fossil fuels and climate change is destroying the biosphere.

You will find idiots that claim to explain it, they are just full of excuses. You will see.

It doesn't disturb me that people can create convincing fake photos and videos, no. Somebody determined enough could already do that with existing tools long before gen AI came along. Yes, there'll be more of it now, but that doesn't disturb me either.

Why am I not freaking out about it? Because reality today has shown me that, at least in the US today, we're already living in a post-truth world. Even if you HAVE real, documented video footage of an event, there are literally millions of people who will deny that evidence in favor of a narrative spun by their favorite vindictive politician or authority figure. That thinking started well before gen AI came along. Even if gen AI magically vanished overnight, it would still be with us. Those folks don't NEED to create convincing fakes to fool people.

And now that everyone knows it's technically possible to do it so easily, there's always going to be some question of whether or not what we see or read is true, no matter how convincing it looks. Even if every nation in the world came together tomorrow to declare a global ban on generative AI tech, that would only affect the general public. They'd still have the tech themselves, regardless of what they told people. It's still out in the wild, open-source stuff, and criminalizing the technology itself won't make it vanish. It just means bad actors would still use it to make illicit content and propaganda, and governments would be free to make propaganda to support their narratives, while the average person would be denied the use of the tech for legitimate creative purposes "for the public good".

So basically my position here is that now that the public knows what can be done with gen AI, the damage has already been done. We can't take it on faith that anything we see in media is true or not, and many people no longer care about (and even willfully deny to themselves) the truth about things, anyway. So that part really doesn't affect anything. We need to start coming to terms with it, because it's the new reality. The technology brings benefits as well, so it's better to embrace that now and start looking for ways to make it work FOR us, rather than vainly trying to force that particular genie back into the bottle.

I think something to remember (and somethign I've seen mentioned pretty seldomly if at all) is most modern technology starts out being less efficient and over time is improved through optimizations on the software side and improvements in hardware architecture (as chips improve, their power usage almost always goes down) . Its my HOPE that this happens for AI as well.

Having said that; the other stuff you mentioned are very real concerns to have and honestly I feel like if someone else doesn't share those concerns they're probably ignoring them intentionally because we've never before had the ability to do some of the things people are doing with AI and as of right now there seem to be very few guardrails .

My hope is that we're able to move forward in a way that allows people the use of this incredibly

transformative technology (and no, I'm not just talking about the ability to make bad art) while still keeping us from totally destroying ourselves and the planet in the meantime.

It's a matter of scale. AI servers use a lot more energy and water than running Photoshop. But while it takes hours to produce something with Photoshop, an AI server is making millions of images every hour, so in terms of resource efficiency, it's more efficient.

u/One_Whole_9927 • 2 points • 2025-10-08 14:46 UTC

AI isn't the problem. It's the data centers and the billionaires that build them. They don't give a fuck about the planet or people. They're chasing God. There is a finite amount of those datacenters that can be built before they begin to seriously degrade the environment. These fucking companies are more than happy to put the burden of these consequences to later generations.
