

China Is Actually Subsidizing Electricity to Cover Up the 'Terrible' Power Efficiency of Domestic AI Chips, Slashing Data Center Bills by Up to 50%

Posted by u/Adventurous_Motor129 • 0 points • 5 comments

And you thought our data centers were energy-hungry.

Renewables can't power growing power demands in the West & OECD Asia/Australia. Maybe that's why China keeps opening new coal plants

I've never really understood, is this sub for or against AI?

u/Adventurous_Motor129 • 1 points • 2025-11-05 14:58 UTC

It was apparent watching the Joe Rogan 3+ hour podcast with Elon Musk, that even he is not sure about the AI outcome.

- Will it be profitable given the number of US competitors?
- Will there be a AI/chip stock bubble?
- Can it be adequately powered. He's using gas turbines in Memphis, not his solar or batteries, despite surrounding rural land.
- Will it cause high unemployment? He talked Universal "High" Income instead of "Basic." That implies high taxes on corporations or socialism.

He also compared it to a bank employee who used to do manual calculator computation before computers. And then there is the physical laborer thing.

But he said AI & robotics were our sole saviors from huge budget deficits, with debt payments already surpassing the War budget. However, if both take over in China, their unemployment problem will be far worse than ours...

Honestly, universal basic income is pretty based. Give people the freedom to actually choose who they want to work for instead of being forced into it.

I like the thought of journalists using AI to write their activist lamentations on climate change and energy policy 😂

u/onlywanperogy • 3 points • 2025-11-04 21:01 UTC

Same logic as towing a diesel generator to charge your car. As long as they feel good, physics matters not.
