

"Poisoning" AI art models only makes your environmental concerns worse

Posted by u/Whilpin • • 0 points • 206 comments

AI gets trained in the background and published when it's done. "Feeding art" into the AI to do an I2I or animate doesn't enter the training data that instant. It simply uses the original as a reference. It doesn't harm the model at all.

Your attempts to "poison" training data. Are also in vain - It doesn't work, and even if it did, there's two points you need to realize:

1. A simple slight blur > sharpen is stupid easy to automate, and instantly removes any poisoning.

And 2. Models will not get published if they are objectively "worse" than the one before. It will simply get retrained. Again. And again.

If AI isn't theft, why should artists have to worry about this in the first place?

I don't know, this video is pretty damn cool [The Art Of Poison-Pilling Music Files] (<https://www.youtube.com/watch?v=xMYm2d9bmEA&t=1215s>)

Yep.yep. benn jordan is amazing. (Saving an image to a mocking bird was genius).

Unfortunately sound works quite differently and our ears are much more sensitive. Additionally there's some wacky stuff you can do to waveforms that we won't perceive but AI does. Like the Doom theme song if you throw it into a waveform visualizer it has a pentagram on it for the whole song (I can't remember if it's a single one, or if it's multiple scrolling like a marquis). But if you blur the waveform, suddenly everything sounds like garbage.

People that hate something not understanding how the thing they hate works? I'm shocked.
