

ChatGPT Alternative That Is Good For The Environment (Not run by a f*cking billionaire)

Posted by u/frankiepisco • 0 points • 35 comments

Gen AI is such a useful tool but Elon Musk or one of those other billionaires having your data is not cute and kinda scary. I have developed an alternative to chatGPT that uses the chip in your phone instead of harmful and polluting data centers. It's fully private, never connects to the internet, and can create images / be chatted with in voice. There's nothing to pay for no data collection. Just trying to do good in the world by solving an unnecessary issue we are facing. If you can help me cause by downloading this app it would mean the world.

No one blamed OP for the way society is. This is in response to an entirely different user who seems to be operating under the assumption that because a technology is physically possible it should exist and also that progress very specifically means creating new or different computer-based technology. What I am arguing is that the progress we should be focused on is progress in social technologies that improve regular people's lives. The issues that "ai" is supposedly going to address are mostly issues that exist because of the way society is organized. We can solve them without pumping more resources into computing.

OPs post is written in such a way that implies they designed an "AI" model on their own that is somehow not connected in any way to a data center and runs on your phone. For this to be true the size of the download must be massive or it must not be particularly useful. It wasn't until they were directly asked that they admitted to just porting an existing model to an app environment.

Machine learning has existed for a very long time, and afaik does not require the massive resource inputs of these LLMs that have been popularized by billionaires for stealing labor, replacing human interaction, and thrusting us further and further into a surveillance state. The technologies that work on cancer detection and your speech to text likely could and would exist without the so-called ai boom of the last couple years. The argument that this is a tool that is only as "good or bad" as the intent behind it becomes a problem in a society that rewards profit and antisocial behavior above all else - which brings me back to the point above about what kind of progress we should be focused on.

That last paragraph is full of nonsense. These models have been proven repeatedly to provide false (and therefore dangerous) information on top of displaying the bias of the programmers and data sets they're trained on. They've also been proven to be pretty easy to trick into doing something that is

against its guidelines. We're talking about a very complicated algorithm. There is no light and love. It's a machine.

The point being made is that there are no good LLMs. The technology, as it exists for regular people to interact with, is a net bad for society. These algorithms don't think. They don't create. They don't innovate.
