The 'Nuclear for AI' Pivot: Are we really restarting Three Mile Island just to power Chatbots?

Posted by u/netcommah • • 0 points • 0 comments

It feels like we're in a weird timeline. Microsoft and Constellation Energy are literally restarting Three Mile Island; the site of the worst nuclear accident in US history—just to feed the insane power demands of AI data centers.

I get that "clean" baseload power is necessary if we want to get off coal, but the optics here are wild. We spent decades being terrified of nuclear, shutting plants down due to public outcry, and now suddenly it's fully back in style because tech giants need gigawatts to run LLMs?

Is anyone else concerned that we are rushing critical infrastructure decisions just to win the "AI Arms Race"? Or is this actually the push nuclear power needed to finally be accepted as a green necessity?

Curious what the consensus is here: Is this a desperate move or a brilliant pivot?
