

what happens when all the drinking water gets sucked up by the ai data centers

Posted by u/miifanatic_1788 • 0 points • 8 comments

obviously humans start dying but what's gonna happen with the data centers and will that be a turning point for regulating ai?

Somewhere around 80-90% of the water in your country is used for agriculture and industry, not for drinking water.

The data centres will do what power stations, manufacturing and mining have always done. They will use industrial water and treat it themselves.

Google will buy a bunch of almond farms, chop down the trees and put the agricultural water into a water treatment facility. The price of almond milk will increase from \$12 -> \$13.

Dude. The AI will be fine. You don't need to worry.

u/DONT_PM_ME_DICKS • 2 points • 2025-12-19 01:00 UTC

we sacrifice humans so the AI can thrive!

It will drain into bodies of water and the water cycle will continue as it always has

u/KronusIV • 2 points • 2025-12-19 01:20 UTC

Actually, the water is mostly used in evaporative cooling. So it gets dumped into the air, not the local water shed.

not sure, but it would be great if in a couple years technology had advanced enough that we could filter seawater effectively for human consumption.

Mad Max era...only the strongest will survive

u/Tiny_Frosting_3953 • 1 points • 2025-12-19 01:01 UTC

We'll probably just start farming our own piss like in Dune before anyone actually regulates big tech lmao
