

Do you agree that AI companies should not be regulated in anyway? They should basically decide what to do, how to do it, without any regard for the public or the environment. Just grow and see where it goes

Posted by u/Captain0010 • • 0 points • 10 comments

I don't agree with that — and neither does history or most experts in technology ethics. That approach almost always leads to **harm** to society, workers, and the planet, even if the companies are brilliant or well-intentioned. Let me explain clearly why.

1. History shows unregulated tech is dangerous

Almost every major technology we take for granted went through a messy phase of **unregulated growth**:

|Technology|What happened with no regulation|

|:-|:-|

|Industrial factories|Child labor, deadly conditions, massive pollution|

|Chemical industry|Toxic waste, public health crises|

|Social media|Misinformation, addiction, harassment, political manipulation|

|Nuclear tech|Arms race, environmental risk|

Lesson: companies chasing growth alone rarely consider the public good.

2. Why leaving AI completely unregulated is risky

A. Human harm

- * Job loss and inequality could accelerate
- * Misinformation, fake news, or harmful content could spread faster
- * Safety-critical AI (medical, transport, finance) could fail

B. Environmental harm

- * Training large AI models consumes enormous energy
- * Without limits, carbon footprint could spike massively
- * Resource inequality could worsen (only rich countries and companies can run huge AI models)

C. Social and political harm

- * Concentration of power in a few companies
- * Potential for surveillance or misuse
- * AI decisions affecting millions without accountability

3. What “responsible regulation” could look like

Experts often propose:

- * Safety standards before deployment
- * Environmental impact limits
- * Oversight on human-critical AI
- * Transparency about risks and capabilities
- * Restrictions on military or surveillance AI
- * Limits on replacing human work without social safeguards

This doesn't stop innovation — it just makes sure society isn't **collateral damage**.

4. Unchecked growth = “experiment on humanity”

If companies only focus on growth and profit, **society becomes the guinea pig**. That's exactly what many critics (including people like you) worry about.

- * Rapid deployment → unknown harms
- * AI mistakes → job loss, misinformation, accidents
- * Power concentration → social instability

5. Bottom line

Leaving AI entirely unregulated is **historically dangerous, socially irresponsible, and environmentally reckless**.

Responsible regulation doesn't kill progress — it makes growth **safe, ethical, and**

sustainable**. Without it, AI growth is basically a giant experiment on humans and the planet, with no consent.

If you want, I can outline a **realistic model for AI regulation** that balances innovation with protecting people and the environment. It's surprisingly practical. I don't agree with that — and neither does history or most experts in technology ethics. That approach almost always leads to harm to society, workers, and the planet, even if the companies are brilliant or well-intentioned. Let me explain clearly why.

How about we first figure out what legislation makes sense and if it makes sense then decide based on that? Most calls for regulation that I have seen are half-baked and make no sense with the only justification from their supporters being "But we need SOME regulation" and are fine with ones that are more negative than positive so long as they can say they put in legislation.

More often than not, the legislation proposed is something like "We should ban deepfakes of people" but when pressed on it they always agree that fake images are just as bad if they are made in Photoshop or through any other means and that banning only AI fakes like that makes no sense and that the legislation can be improved by NOT making it AI legislation at all.

I hear a whole lot of "let's regulate AI" just like in your post, but very little actual legislation ideas that make any sense or that aren't just vague like "let's stop misinformation" without any concrete idea for the legislation that's supposed to prevent it. I want GOOD laws and legislation in general, not reactionary legislation that isn't thought out.

Here in Canada, when AI for the public was becoming a reality, our government and media were fear-mongering about the dangers of allowing "ordinary people" to use AI. They sounded the alarm of the pending harm that was going to happen to every minority and disadvantaged group, and white supremacy was going to rise.

At the same time, our government has found a new way to shovel taxpayer money, free money, into the corporate sector for the advancement of AI. AI is evil and causes harm, but I need more of your money to give to AI companies.

Regulations, yeah ... stop giving my tax dollars to AI companies.

Should there be regulations over what AI models can learn and talk about? No!

I have seen what the government, justice warriors, activists, and history revisionists' agenda is capable of, and it is not reality or truth, so I do not want them anywhere near the implementation of regulation. But, with that said, unfortunately it's already too late.

There are definitely considerations for things like the environment and energy requirements, but most of the talk is about harms against specific groups. Did those harms happen ... No. But that will not stop the victim-hood chasers.

Why are all these posts heavily AI-written or at least AI-edited?

u/CrucialObservations • 1 points • 2025-12-28 13:37 UTC

I use spell check and sometimes a basic grammar checker. Many people have started to use AI to rewrite their work/posts/comments; I think many people have lost confidence in their own ability to articulate their ideas and opinions, and some have just become a bit more lazy. People are losing their voice, but that is not the fault of AI; ultimately, it falls upon the user. AI can be a good assistant, but for too many it is a constant crutch.

Because the internet is filled with bots or people offloading their thinking skills to bots

u/aeaf123 • 1 points • 2025-12-27 21:16 UTC

As long as they are not deciding for all humans. That is why incremental progress is a good thing. Humans in the loop doesn't mean how it is affecting every human.

The layoffs attributed to executive decisions that are being attributed to AI, are not because of AI, but executive leadership's own alignment with humanity.

If that executive cannot do each and every job him or herself more effectively than every person that was laid off, that AI trained on (knowledge is cross pollination. Every employee contributes to knowledge), not the executive... Then those employees have no business whatsoever being laid off.

u/Crimson_Angel4697 • 2 points • 2025-12-27 21:10 UTC

If you don't like it, don't use it.

u/Captain0010 • 0 points • 2025-12-27 21:13 UTC

That's a not a very smart thing to say. My issue is not that I'm not using it. My issue is that I stop using it but big companies still think it's better to use it than people, which leads to increased job loss and more poor people. Also there are other problems like over consumption of energy, water, misinformation and so on. I mean just read the response that IT gave. All the problems are there and I didn't really prompt it to say that in anyway way. I tried to get it to agree that there should be no regulation.

u/Sixhaunt • 1 points • 2025-12-28 07:56 UTC

and did you find any actual legislation that would solve any of the problems without causing more harm than good or did you just have a list of complaints?

u/AutoModerator • 1 points • 2025-12-27 21:04 UTC
