

Personal AI usage impacts on environment

Posted by u/Last_Percentage9802 • 0 points • 46 comments

On a broader scale, I hate AI. I think we would be better off if we never advanced AI to this level, and I think it'll only make us worse off as time goes on. Some people argue it's wrong to use AI because of its environmental impact. But on a personal level, how realistic is it to not? If you're using it for stupid and insignificant reasons, then I think, maybe, don't do that. But now jobs, school, and pretty much everything relies on AI. It's almost like if you don't use it, it's an inconvenience. And don't we love convenience in this society? Strictly speaking, yes, I think it's unethical to use AI because of that impact. But why is it seen as different from anything else that is also unethical in this way? Some of the technologies we use every day also have negative environmental impacts, but we use it anyway because of convenience and don't give the ethics of it a second thought. I recognize that it's not a good thing, but if we presuppose that not using AI can make your life less convenient and even put you behind in this day and age, what makes it so different from other types of harmful conveniences? Maybe it comes from the fact that AI is so new, and of course, this doesn't consider the problematic non-environmental implications of AI. I hate AI (in the chatgpt sense) and I wish it never existed, but now that it does, on a personal level, how morally responsible are we for using it?

Individual responsibility for this shit?

Profit seekers put make wasteful tools available so that clueless people can burn drinking water to ask "are you really conscious".

This is corporate irresponsibility.
