

AI using water isn't the best strategy against AI. Here's why;

Posted by u/hogballs0318 • • 0 points • 61 comments

AI uses about give or take 2 million to 5 million gallons of water everyday, that may sound alot of but in comparison to other simple things such as Agriculture, Drinking, Ecosystems, Hygiene/Sanitation. We use alot of it, unesco.org released some stastistics available to the public, the pie chart listed does not even mention AI.

Here's the thing, we drink more water than AI uses, the thing that is functionally avoidable, drinking water consumes more than AI *EVER* will.

And that doesn't even mention agricultural needs, USGS.gov statistics display that agriculture uses around about 224,000 million gallons of freshwater. Which esentially dwarfs AI totally.

While AI has it's share of problems, compared to everything else, their water impact is relatively low. There are better arguements against AI such as ethics, but I won't get to deep into that, this is about water!

I encourage you do your own research before partaking in any arguement or debate regarding AI as it is an extremeley new and evovling technology. But do share your thoughts.

People also forget that, the water being used is not being transformed into something else, like hydrogen and oxygen. It's till just water at the end of the day. So in short, the water isn't going anywhere lmao
