AI data centers can now use as much power as New York State usage (hottest days of the years)

Posted by u/BuildwithVignesh • 0 points • 1 comments

Energy will be the **biggest bottleneck** in the coming years.

The AI data center energy demand is already greater than that of the whole of New York City on the hottest days of the years. Without fusion energy, it will be **difficult** to achieve superintelligence.

Therefore, the focus will likely be increasingly placed on this area in the future. It's **no coincidence** that Sam Altman invested in Helion.

Report: This data is from our new AI Chip Sales hub, based on financial reports, company disclosures & more to estimate compute, power usage, and spending on a wide variety of chips.

How is 'others' calculated? Because I think Hank Green pointed out a report reached its conclusion (about AI water usage) by adding the amount of water used to run power plants in addition to the water used to run the data centres themselves.

Either way, this looks extremely fishy with all the "extrapolated from incomplete data", "on the hottest days", even the fact that we're comparing global power usage to a single city. I highly suspect this is using statistics to tell a lie.
