

US leads record global surge in gas-fired power driven by AI demands, with big costs for the climate | Greenhouse gas emissions

Posted by u/EchoOfOppenheimer • 0 points • 3 comments

A new report reveals that the US is leading a record global surge in gas-fired power plants, driven almost entirely by the ravenous energy demands of AI. The investigation finds that the US is set to triple its planned gas capacity, with a third of these new plants being built **directly on-site** at data centers. While tech giants promise 'Net Zero,' they are actively hard-wiring decades of fossil fuel emissions into the grid to keep the chatbots running.

A new analysis shows the U.S. now has the largest pipeline of new gas-fired power plants in development in the world, mostly to meet soaring electricity demand from AI data centers and other tech industry loads. If all planned projects are built, U.S. gas-fired capacity would grow by nearly 50% — at an estimated \$416 billion in capital costs. Texas, in particular, accounts for about a third of that planned capacity, with nearly 40 GW intended to directly power data centers.

This appears to be an anti AI bot account that farms Karma by posting dozens of these every day

But is it wrong? First I've seen it

"Chatbots" is the most reductive term you can possibly apply to the value that AI creates. Nice job bot.
