

When AI becomes infrastructure: from potable water to mental health | Futurium

Posted by u/lcy_Stretch_7427 • • 0 points • 0 comments

AI safety usually focuses on local failures: bias, hallucinations, benchmarks.

But systems we use every day may have cumulative cognitive and mental-health effects — not because they fail, but because they persist.

Potable water isn't about one toxic glass.

It's about long-term exposure.

So if AI is infrastructure:

- Where are the metrics for chronic human–AI interaction?
- Attention, dependency, cognitive narrowing?
- Can ML even evaluate long-term effects, or only task performance?

Curious whether this is a real research gap — or just hand-wavy ethics.
